professional camera support

www.prosup.com

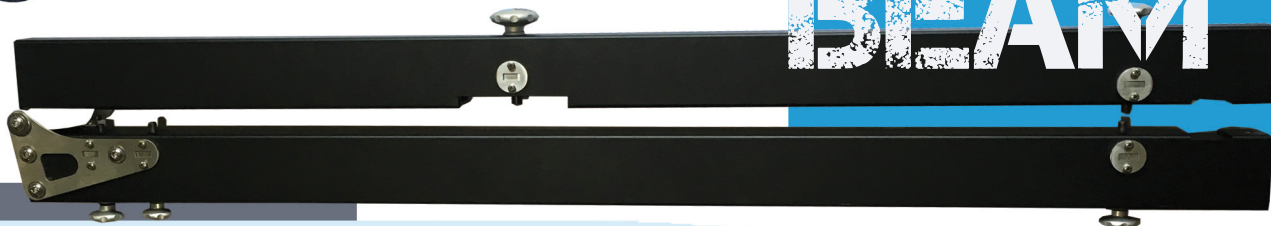

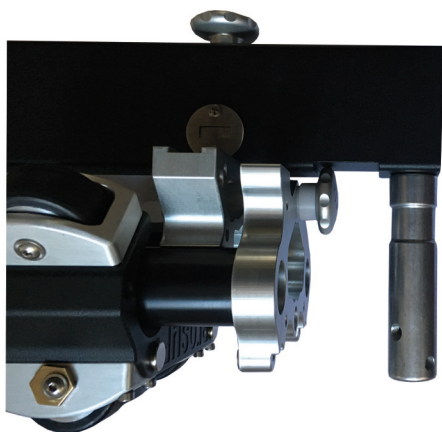

The newly introduced Tango Beam enables the fully assembled Tango Kit (2,20m track length) to be used in an undersling mode within seconds.

Underslinging can be useful sometimes in order to have no camera equipment such as tripod legs etc. below you. Therefore the camera must be supported from the top. Usually that means a lot of work. You have to build a truss or any other construction to hang from.

The Tango Beam, however, can work off two heavy duty light stands which you usually find on any set. Connected with two 28mm spigots the spanned Beam can be raised to the desired height.

The camera, hanging on the inverted Tango Roller, can now tilt down 90°.

The Prosup undersling bracket inverts the camera again if needed.
